

An excellent training company

As part of its ongoing training and development programme, James Neill's / Allied Mills identified a requirement for basic mechanical training for production operators. A number of training providers were contacted and course details obtained and, from the beginning, it was clear that Technical Training Solutions were an excellent training company.

A number of different options were considered, but James Neill's / Allied Mills decided to complete a number of Operator Reliability training courses on-site, with TTS providing all training materials and test / simulation rigs.

The courses are three days in duration, with delegates covering topics such as machine isolation, hand tools, assembling / dismantling machines, identifying worn / damaged components, aligning components and cleaning / lubrication.

James Neill's has now completed two courses to date

and feedback from delegates has been extremely positive, with all delegates reporting that relevant training was delivered to a very high standard. Delegates have already put into practice what they have learnt, by not only carrying out minor repairs themselves, which normally would have required a maintenance resource, but, more importantly, by identifying potential problems before a plant failure occurs.

In summary, the training provided by TTS is of a high standard and has allowed James Neill's to continue with structured people development, benefiting both individuals and business performance.
